

# HKDSE

This course caters for students with various backgrounds and abilities. It aims at helping students to consolidate what they have learned through basic education, broadening and deepening their learning experiences, as well as further enhancing their positive values and attitudes towards the learning of mathematics. Topics will be taught:

## Number and Algebra Strand

1. Quadratic equations in one unknown
2. Functions and graphs
3. Exponential and logarithmic functions
4. More about polynomials
5. More about equations
6. Variations
7. Arithmetic and geometric sequences and their summations
8. Inequalities and linear programming
9. More about graphs of functions

## Measures, Shape and Space Strand

10. Equations of straight lines
11. Basic properties of circles
12. Loci
13. Equations of circles
14. More about trigonometry

## Data Handling Strand

15. Permutations and combinations
16. More about probability
17. Measures of dispersion
18. Uses and abuses of statistics

# Learning Objectives

## Number and Algebra Strand

- extend the concepts of numbers to complex numbers;
- further investigate and describe relationships between quantities using algebraic symbols;
- generalize and describe patterns in sequences of numbers using algebraic symbols, and apply the results to solve problems;
- interpret more complex algebraic relations from numerical, symbolic and graphical perspectives;
- manipulate more complex algebraic expressions and relations, and apply the knowledge and skills to formulate and solve real-life problems and justify the validity of the results obtained; and
- apply the knowledge and skills in the Number and Algebra strand to generalise, describe and communicate mathematical ideas and solve further problems in other strands.

## Measures, Shape and Space Strand

- use inductive and deductive approaches to study the properties of 2-dimensional figures;
- perform geometric proofs involving 2-dimensional figures with appropriate symbols, terminology and reasons;
- further inquire and describe geometric knowledge in 2-dimensional space using algebraic relations and apply this knowledge to solve problems;
- inquire and describe geometric knowledge in 2-dimensional space and 3-dimensional space using trigonometric functions and apply the knowledge in solving related problems; and
- apply the knowledge and skills in the Measures, Shape and Space strand to generalise, describe and communicate mathematical ideas and further solve problems in other strands.

## Data Handling Strand

- understand the measures of dispersion;
- select and use the measures of central tendency and dispersion to compare data sets;
- further investigate and judge the validity of arguments derived from data sets;
- acquire basic techniques in counting;
- formulate and solve more complex probability problems by applying simple laws; and
- integrate the knowledge in statistics and probability to solve more complex real-life problems
